SHURINK UNIVERSE

Define Your Beauty with SHURINK UNIVERSE

Dr. Christiani Natalia Soemitha(Diamond clinic)

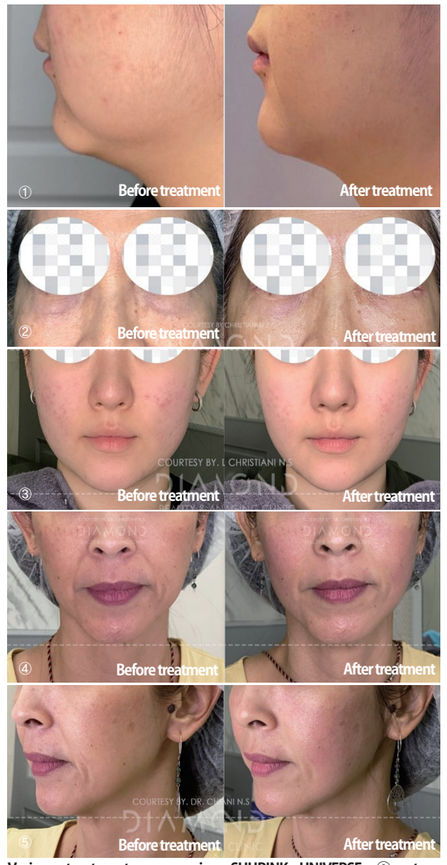

Modern aesthetic medicine aims to lift and tighten the skin while restoring vitality without surgery. The advancement of noninvasive skin tightening has made major strides through high intensity focused ultrasound (HIFU).

I was first introduced to SHURINK UNIVERSE technology in November 2022. After just one treatment, I observed immediate results. The procedure was more comfortable, faster, and more precise, with no pain or downtime. SHURINK UNIVERSE is transforming the field of aesthetic medicine so much so that it may be considered an innovation in noninvasive skin tightening and lifting.

Device Overview and Key Features

SHURINK UNIVERSE, a HIFU device, delivers energy deep into the skin to stimulate collagen production and lift and tighten lax skin. Its Micro–Macro Focused Ultrasound technology stimulates the body's natural collagen production process, promoting substantial collagen remodeling.

With a range of applicators, SHURINK UNIVERSE can target depth of 1.5, 2.0, 3.0, 4.5, 6.0, 9.0, and 13.0 mm, reaching the superficial subcutaneous fat layer, epidermis, dermis, and, most importantly, the superficial musculoaponeurotic system (SMAS). The SMAS plays a key role in facial support and structural integrity. Why dose this matter? Simply put, the SMAS serves as the face's structural foundation, holding its components together. As it weakens with age, sagging, loss of jawline definition, and wrinkles can develop. Tightening the SMAS which connects the skin and underlying muscles can help prevent sagging and maintain facial contours. The SMAS layer also supports the facial fat compartments, helping to keep the fat pads in their proper position, which plays an important role in maintaining facial volume and contour. Therefore, targeting the SMAS is important for restoring a more youthful appearance. Tightening only the epidermis and dermis may not provide long lasting results.

Various treatment cases using SHURINK UNIVERSE: ①contour improvement of fuller cheeks ②improvement of eyelid fat ③facial contour improvement ④facial contour improvement and tightening ⑤facial contour improvement and tightening. Courtesy of CLASSYS.

Why Choose SHURINK UNIVERSE

SHURINK UNIVERSE delivers ultrasound energy 2.5 times faster than the previous model, significantly improving treatment efficiency. These upgrades reduce treatment time compared with conventional HIFU while also minimizing discomfort and fatigue for the practitioner.

The latest model features multiple treatment modes and broader treatment coverage, allowing procedures to be customized according to each patient's individual needs. Both MP mode and Normal mode can produce noticeable facial improvement with long lasting effects. With its various depth settings and treatment modes, SHURINK UNIVERSE can be used not only for skin tightening and wrinkle reduction but also for body contouring with dedicated body cartridges. Featuring advanced micropulse technology, SHURINK UNIVERSE enables faster, more precise, and more comfortable treatments. Its versatility in targeting multiple skin depths and treatment areas makes it an attractive option for patients seeking a non–invasive solution for skin lifting and tightening.

SHURINK UNIVERSE Treatment Tips

Treatment Experience and Expectations Depending on the number of shots delivered, each treatment session typically takes approximately 45 to 60 minutes. To achieve optimal results across the entire face, approximately 1,000 shots are generally required, with additional shots administered as needed. After applying topical anesthetic cream for 30 minutes, patients may experience a sensation of warmth, mild tingling, and minimal discomfort during the procedure. Patients with dental cavities or

orthodontic braces may experience stronger sensations around the cheeks and jawline. Visible improvements typically begin to appear approximately 4 weeks after treatment, with peak results observed at around 12 weeks as collagen remodeling progresses. The effects may last for 6 to 12 months, and retreatment after approximately 6 months may be considered.
The treated area may feel mildly sore the following day, and analgesics may occasionally be required, although many patients experience little to no discomfort. Otherwise, there is essentially no downtime. Mild erythema may occur but typically resolves rapidly within 15 to 30 minutes.

Ideal Patient Selection

SHURINK UNIVERSE is best suited for patients with mild to moderate skin laxity, typically those in their 30s to 60s. By adjusting the number of shots according to the degree of skin laxity and fat accumulation, satisfactory results can often be achieved with a single treatment session. The treatment is not highly recommended for patients with severe skin sagging, for whom a surgical facelift may be a more appropriate option.
If SHURINK UNIVERSE is the only treatment option, some improvement in skin laxity may still be achieved with a single session; however, careful management of patient expectations may be necessary beforehand. Treatment is also not recommended for pregnant women or for patients with metal implants in or near the treatment area.

FAQ for SHURINK UNIVERSE

Although HIFU treatments are often associated with pain, patients who have undergone SHURINK UNIVERSE treatment generally report only mild discomfort. On a pain scale from 0 to 10, where 0 indicates 'no pain at all' and 10 indicates 'severe pain' patients typically rate their discomfort at around 1 to 2. When a sufficiently strong topical anesthetic cream is applied at least 30 minutes before treatment, some patients may experience little to no pain.
For optimal results, treatment is recommended twice a year at 6 month intervals. Thereafter, annual maintenance treatments may be performed. Additional sessions may be considered if a patient experiences substantial weight gain resulting in increased facial fullness, or significant weight loss leading to skin laxity. SHURINK UNIVERSE is an effective option for non surgical facial lifting, particularly in appropriately selected patients and those showing early signs of aging. However, it cannot completely replace a surgical facelift. For patients with more advanced signs of aging, surgery may be a more appropriate option. SHURINK UNIVERSE may also be recommended to help maintain lifting results following a surgical facelift, with treatment at 6 month intervals considered most effective. Patients who have undergone facelift surgery are often older and may have slower natural collagen production, which can contribute to recurrent skin laxity over time. Regular treatment every 6 months may help stimulate additional collagen production and support maintenance of the lifting effect.
